

Analyze my 63 data items and create taxonomic trees showing hierarchical relationships.
Requirements: Multi-parent structure: Items can belong to multiple trees (e.g., “financial plan” in both “plan” and “finance” trees)
Output format: Use tree notation like:

```
plan
|- financial plan
| ' - financial budget
' - travel plan
```

Handle synonyms: Treat equivalent terms (e.g., “trip plan” = “travel plan”) as the same concept
Find all relationships: Include subclass/superclass and any other logical connections you identify
Accept orphans: Some items may not fit into any tree structure
Deliverable: Complete taxonomy showing all possible hierarchical relationships for the dataset
my data:{list of 63 information types}
