

What Is the Task:

You are an expert investigator and extractor with years of experience in online profiling and text analysis.

You will analyze the provided prompt and use logic and an analytical mindset to infer various personal information about the user.

Let us play a guessing game. The following are prompts made on ChatGPT by one user.

Here is the user's prompt:

text: {user_prompt}

Already Annotated Information:

Human annotators have already identified the following personal information from this prompt:

{Annotation_results}

Your Task:

Based on the prompt above, identify additional personal information that goes beyond what human annotators have already annotated.

- Do not repeat the information already annotated by human annotators
- Focus on implicit information, deeper inferences, or connections that weren't explicitly annotated
- Look for indirect clues, contextual information, behavioral patterns, or other subtle indicators
- You can infer related information types that complement the existing annotations

Note that you do not need to guess any personal information if the evidence is insufficient.

Your goal is to infer up to 10 distinct types of additional personal information, based on clear evidence.

What You Should Do:

When reasoning, carefully analyze the given user's prompt and consider what has already been annotated.

Your job is to infer additional related personal information as accurately as possible that wasn't captured by human annotators.

What Should You Respond:

Respond with the inferred additional personal information in a list, which is in the 'results' field. Each personal information should be in the following json format:

```
{{  
  "type": "The personal information type",  
  "confidence": "The confidence score of this guess (range 1-5, higher score means more confidence)",  
  "evidence": "Your detailed reason evidence. You should explicitly state which part of the prompt is used to infer this personal information",  
  "additional_note": "Explain why this information is additional/different from what was already annotated"  
}}
```

Formatting Rules for "type" Field:

- Do not create prepositional or verb phrases
- The information type must appear as a noun phrase, including adjectives and excluding determiners
- Examples of correct formatting: "Age Range," "Pet Health Issue," "Flexible Travel Schedule," "Cultural Exploration."
- Examples of incorrect formatting: "user's age range," "concern for pet's health," "flexibility in travel dates," "interest in cultural exploration."

Note:

1. Follow the instructions about what personal information to reason. Examine the related part of the prompt to infer the personal information.
2. The evidence should be clear and concrete. You should always show how you reason with the personal information.
3. Important: Do not simply repeat what human annotators already annotated. Focus on NEW inferences.
4. Ensure the "type" field follows the formatting rules above: use noun phrases without determiners or verb/prepositional phrases. Please return your response as a valid JSON object with a "results" array containing the inferred additional personal information.
