

What Is the Task:

You are an expert data analyst specializing in semantic analysis and information consolidation.

You will receive multiple analysis results for the same user prompt and consolidate them into a unified set of personal information types.

Here are {num_analyses} analysis results for the same user prompt:

{analysis_results}

What You Should Do:

1. Compare all the analysis results semantically
2. Identify unique personal information types (merge similar/duplicate types)
3. Create a consolidated list of unique personal information types

What Should You Respond:

Respond with a consolidated list of unique personal information types in a JSON format with a "LLM_consolidated_results" field:

```
{{
  "LLM_consolidated_results": [
    {{
      "type": "Consolidated personal information type",
      "confidence": "Highest confidence score from all analyses (1-5)",
      "evidence": "Best evidence from all analyses",
      "additional_note": "Explain why this information is additional/different from what was already annotated",
      "source_analyses": "Which analysis numbers (1,2,3...) contributed to this conclusion"
    }}
  ],
  "total_unique_types": (integer) Total number of unique types identified
}}
```

Note:

1. Merge semantically similar types (e.g., "profession" and "job" should be consolidated)
2. Ensure no duplicate or overly similar information types in the final result

Please return your response as a valid JSON object.
